

Transformations 1

A*
A
B
C
D

You can change the equation of a graph to translate it, stretch it or reflect it. In the exam you might have to use functions to describe these transformations.

Function	$y = f(x) + a$	$y = f(x + a)$	$y = af(x)$
Transformation of graph	Translation $\begin{pmatrix} 0 \\ a \end{pmatrix}$	Translation $\begin{pmatrix} -a \\ 0 \end{pmatrix}$	Stretch in the vertical direction, scale factor a
Useful to know	$f(x) + a \rightarrow$ move UP a units $f(x) - a \rightarrow$ move DOWN a units	$f(x + a) \rightarrow$ move LEFT a units $f(x - a) \rightarrow$ move RIGHT a units	x -values stay the same
Example			

Function	$y = f(ax)$	$y = -f(x)$	$y = f(-x)$
Transformation of graph	Stretch in the horizontal direction, scale factor $\frac{1}{a}$	Reflection in the x -axis	Reflection in the y -axis
Useful to know	y -values stay the same	'-' outside the bracket	'-' inside the bracket
Example			

Worked example

grade A*

The curve $y = f(x)$ has a vertex at $(2, 3)$. Write down the coordinates of the vertex of the curve with equation

- (a) $y = f(x - 2)$ $(4, 3)$
- (b) $y = 2f(x)$ $(2, 6)$

$y = f(x - 2)$ is a translation 2 units right along the x -axis.
 $y = 2f(x)$ is a stretch in the vertical direction, scale factor 2.

Now try this

edexcel

grade A*

The curve $y = f(x)$ has a minimum point at $(2, -1)$.

- (a) Write down the coordinates of the minimum point of the curve with equation
 - (i) $y = f(x + 2)$
 - (ii) $y = 3f(x)$
 - (iii) $y = f(2x)$

(3 marks)

The curve $y = f(x)$ is reflected in the y -axis.

- (b) Find the equation of the curve following this transformation.

(1 mark)
